

I very much appreciated the feedback on this module. I particularly noted the comments I got about my module's use of Astropy's BoxLeastSquared (BLS) method and how confusing that topic is, especially as my module is geared towards an undergraduate audience. To combat this, I split my module into three separate modules, and made the second one an exploration of Fourier transforms as they follow the same methodology as BLS, but are more commonly used. Additionally, the positive feedback I received on the first part of my module, Observing the Earth, inspired me to expand that into its own module, since I was already expanding my second section. Finally, I received a comment about doing more with plotting and visualization in my module, which I completely agreed with. So, I revised the plots in my last two sections (now Module 2) and applied some cuts between the thick and thin disks that were referenced in a paper we read in class (Mackereth et al. 2019; Akaba et al. 2026).

Finally, while reviewing Sasha's module, I really appreciated how she placed her learning goals at the top of her module to make them front of mind for the reader. I decided to change my module to do the same.
